

Earn context before prescribing a portfolio.

A starting hypothesis based on the public role description and company evidence

DAY-120 OUTCOMES

Shared direction

Enterprise adoption thesis linked to business objectives, employee experience and decision rights.

Visible portfolio

Verified inventory of active use, proposed work, owners, dependencies, risk and status.

Proven mechanism

Two bounded workflows commissioned with explicit authority, enablement and evidence.

Installed capability

Practical CoE, ambassadors, scorecard and repeatable pilot-to-pattern playbook.

12-MONTH HORIZON

Desired state: AI adoption is no longer a campaign or collection of tools. It is a visible operating discipline: business-owned, technically supported, responsibly governed, role-enabled and measured by work outcomes plus employee confidence.

FIRST-WEEK LISTENING AGENDA

Executive and functional leaders

- Clarify expectations, decision rights and success narrative.
- Ask for one valuable workflow, one feared failure and one change employees adopted well.
- Understand current investment, technical commitments and governance.

Employees and managers

- Observe current systems, handoffs, workarounds and informal support.
- Listen for rational skepticism, unequal access and career concerns.
- Identify trusted informal teachers and existing local experiments.

QUESTIONS THE FIRST 30 DAYS MUST ANSWER

Value and workflow

Which workflows constrain growth, customer service, margin, capacity or employee experience? Where is value already visible?

Technology and risk

What tools, data, vendors, support paths, legal boundaries and security requirements already exist?

People and adoption

Where are curiosity, fear, confidence, access and change fatigue? Who teaches others?

Evidence and economics

How are usage, quality, risk, value and employee confidence currently measured?

DAY-30 EXECUTIVE DECISION

Agree on two bounded workflows to commission, the owners and evidence required, the support model, and what will explicitly remain out of scope during the first 120 days.

Choose work that can teach the organization.

The first pilots should maximize learning credibility—not novelty

OPERATING PRINCIPLES

Principle	Behavior
Listen before prescription	Workflow observation, employee signal and prior-change learning precede tool selection.
Business-owned work	Every use case has a functional owner accountable for the outcome and adoption.
Human authority by design	Approval, override, escalation and support are explicit before launch.
Evidence before expansion	Scale follows quality, sustained use, confidence, access and business evidence.
Capability over dependence	Standards and enablement help teams make better decisions rather than wait for a central group.

DAYS 31–60 • SELECT AND DESIGN

Move	Work	Deliverable
Prioritize	Use business value, owner commitment, context/data readiness, risk, adoption burden and reuse potential.	Two selected workflows + explicit non-selections
Fit	Complete the Job Signal / Context + Data / AI Role / Human Authority / Proof + Reuse review.	AI Fit-to-Work Reviews
Design	Define user journey, source context, prompts or logic, checkpoints, exceptions, support, evaluation and rollback.	Pilot charters and workflow maps
Prepare	Recruit trusted users and managers; practice with real cases; refine language and support before launch.	Role-based enablement and ambassador cohort

PILOT SELECTION GUARDRAILS

Credible value The workflow matters enough to justify change and has a visible comparison baseline.	Engaged ownership A functional leader and employee users will co-design, review evidence and own the outcome.	Bounded learning The pilot can test a narrow AI role, explicit authority and a reversible path within the first 90 days.
---	---	--

Use bounded work to prove the adoption mechanism.

Visible support and weekly decisions turn pilots into trustworthy evidence

DAYS 61–90 • OPERATE AND LEARN

Weekly pilot review

Business owner, IT/Data, risk partners and adoption lead review evidence, failure modes and decisions.

Visible support

Office hours, manager reinforcement, quick reference, example library and escalation path.

Learning discipline

Log corrections, overrides, abandonment, recurring questions, workarounds and reusable components.

ILLUSTRATIVE PILOT SCORECARD

Question	Evidence category	Decision use
Is the workflow better?	Cycle time, rework, backlog, service, capacity, decision quality	Validate or reject the value hypothesis
Is use appropriate?	Evaluation, correction, override, escalation, auditability	Tighten AI role, context or human checkpoints
Are people adopting it?	Eligible use, depth, abandonment, workarounds, support demand	Repair workflow fit or enablement
Do people feel capable and safe?	Confidence, clarity of limits, access to help, equitable access	Improve training, communication and support
Can the pattern travel?	Reusable components, stable data, owner, known failure modes	Scale, repair, hold or stop

DAY-90 DISPOSITION

Scale

Evidence supports wider use with a named owner.

Repair

Value remains but fit, controls or enablement need redesign.

Hold

Readiness or evidence is insufficient for the next step.

Stop / human-led

The work does not justify additional AI involvement.

COMMUNICATION CADENCE

Executive sponsor update every two weeks; functional-owner decision review weekly; office hours weekly; ambassador learning circle biweekly; concise employee communication tied to real work and explicit limits; Board-level reporting only after evidence definitions are stable.

Turn pilot learning into an operating system.

Make the next good decision faster without centralizing every decision

PRACTICAL CENTER OF EXCELLENCE

Services • Use-case intake and fit review • Responsible-use and human-authority patterns • Evaluation and business-case support • Platform/vendor coordination • Reusable workflow and enablement assets	Operating posture • Enabling core, not gatekeeping bureaucracy • Business owner retains workflow accountability • Clear service levels and escalation • Portfolio transparency and explicit stop decisions • Feedback reaches standards quickly
---	--

AMBASSADOR AND ENABLEMENT SYSTEM

Element	Design	Evidence
Ambassadors	Trusted, role-diverse employees with protected learning time and direct feedback channels	Participation, support contribution, peer reach, recurring friction themes
Role pathways	Foundation, workflow practitioner, owner/approver and builder/support tracks	Capability demonstration, confidence, appropriate-use behavior
Manager system	Conversation guides, example work, limits, reinforcement and escalation	Team participation, clarity, support load, adoption depth
Employee feedback	Office hours, pulse questions, workflow observations and visible response to concerns	Trust themes, unresolved concerns, access and improvement backlog

EXECUTIVE PORTFOLIO SCORECARD

Outcome Workflow value, customer or employee consequence and economic evidence.	Trust and control Quality, exceptions, auditability, human authority and risk posture.	Capability Adoption depth, confidence, equitable access, reuse and learning speed.
---	--	--

DAY-120 EXECUTIVE REVIEW

- What changed in the work, and what evidence remains incomplete?
- Where did employee skepticism expose a real design problem?
- Which components, controls and enablement patterns are reusable?
- Which use cases should enter the next fit review?
- What team shape, vendor posture and investment are justified by evidence?
- What should remain explicitly out of scope?
